IS 543 – Homework #6

September 30th 2019

Rose: I loved learning about things I didn't already know how to do. There were plenty of times in the videos where you showed a way of doing something built into the swift language that I had previously had to implement on my own because I didn't know it existed. For example learning exactly how to properly use user defaults to save data even after closing the app was helpful for not only the pushup application, but also my other side projects. Another thing I loved learning about was preserving app states so that users can return to what they were doing without having to start all over again.

Bud: I want to refactor a lot of my old projects using the things I learned in order to clean up and reduce the amount of code. Swapping hundreds of lines of self-implemented code with a single line from a built in function in swift will greatly improve the quality and readability of my code.

Thorn: I honestly don't have many thorns for these videos. Being able to watch them at whichever speed I wanted at any time was helpful and made things less stressful with my busy schedule. I feel like the videos are well paced and filled with the right amount of information. The one thing I didn't like was in the preserving app state videos. I wish it had explained the updated iOS 13 way of preserving app state instead of the older iOS 12 way.
